Terminal (officially called Terminal app) is, strictly speaking, an emulator and works off most typical UNIX commands (OS X is a UNIX-based system, as opposed to Windows, which is NT-based).. It's a knowledge that only geeks and geniuses have Here are some commands with the most impressive features.. In the Terminal app on your Mac, use the mv command to move files or folders from one location to another on the same computer.

1. commands terminal
2. commands terminal linux
3. command terminal windows

The mv command moves the file or folder from its old location and puts it in the new location.. Terminal is one of the most important tools in MacOS be it any field To get good knowledge about the terminal is important.. It teaches you many things in an innovative way which is liked by most of the developers.. Unlike OS X, which has a graphical user interface (shortened to GUI), Terminal works off a text-based interface and all commands have to be typed in - this.. The commands used below may or may not be installed in your system To install them use the brew command as follows:Using say commandMake your Mac talk what you want using the say command:https://media.
